H2O GmbH doesn't just insist on pioneering technology in the production of its water treatment systems but also in its new buildings. Under the motto "light, air, sound insulation", the health and well-being of employees are jointly addressed. The issue of sustainability isn't neglected either, with e-mobility, solar panels and groundwater building cooling systems. The new building will open in summer 2019.

Healthy, sustainable growth – this has characterised the last 20 years at H2O GmbH. The company produces wastewater treatment systems to achieve zero liquid discharge in the industrial sector. In summer 2019, H2O GmbH opens its sustainable new facilities. The new building is almost 5,000 square metres in size. With the new production hall, the company has tripled the size of its production area.

The idea behind the new building: shorten routes, improve networking and thus make H2O more productive and with greater capacity for adding value.

As an innovative company, H2O also places great emphasis on pioneering technologies. "That's why we have got a solar panel system on the roof of our new building, which covers our basic supply needs," explains Managing Director Matthias Fickenscher. The company is also promoting e-mobility. "We will be installing six charging stations for e-vehicles in our car park." The existing sustainable groundwater cooling system will also be used for the new premises. The addition of a further storey to the office building creates space for another 20 employees. The company is also emphasising the well-being concept of "light, air, sound insulation" for its employees. Not only is the new 2nd floor being redesigned, but the existing office areas are also being adapted. The new workspaces will offer a space to retreat

and an opportunity to exchange ideas. "We are particularly proud of the active ventilation system," says Fickenscher. "It's like working in the fresh air here!" Not only does this improve the environmental conditions, but it also helps concentration levels. All new desks are electronically height-adjustable to ensure a working posture that is good for your back. Even the sound insulation has been further enhanced with various different elements. "We want to facilitate optimum conditions for concentrating on work but, even more than that, we also want our staff to have a real sense of well-being here," says the Managing Director.

Facts:

- 99kW solar panels cover the basic supply needs at H2O GmbH
- New car park: 6 charging stations for e-vehicles
- Groundwater building cooling: 70% lower CO2 emissions (compared to cooling units)
